CHECK24 Vergleichsportal GmbH
Vienna, Austria

25 June 2026

Dear Hiring Team,

I am applying for the Senior Java Backend Developer position at CHECK24 Vienna. Building product-grade backend services at scale — and owning them fully, from design through deployment — is exactly the kind of work I want to be doing, and it lines up well with what I have spent the last several years doing.

Two parts of my background are a direct match for this role:

- Spring Boot microservices in production: At Dodax, I built and maintained Spring Boot microservices for order processing and vendor management — high-volume, transaction-critical flows with real consequences if something breaks. I brought test coverage to 80% and used Elasticsearch to measure and validate performance improvements. At Broadcom, I delivered REST APIs consumed globally across an enterprise SaaS platform and led a full test migration across the Automation Engine.
- Elasticsearch: I have worked with Elasticsearch across two roles — for search and observability at Broadcom (where a REST search endpoint I built went from hackathon to production release), and for performance validation at Dodax. It is not something I only configured; I built features on top of it.

One honest gap: MongoDB. My database experience is strong on the relational side (PostgreSQL, MySQL, Oracle) and I know Elasticsearch well, but I have not used MongoDB professionally. I am confident I can pick it up quickly given the overlap in how document stores and search indexes model data — and I learn new data layers fast.

On the quality side: clean code and test coverage are habits I already have, not intentions. 10+ years of Java, a test migration that improved reliability on a globally shipped product, and growing coverage from zero to 50%+ in a clinical codebase within one year are concrete evidence of that.

I would be glad to talk through how my background fits the team's current work.

Warm regards,

Meenakshi Subudhi
